

Newest progress

- Tried the new parameter tuning. Using log improved the performance
- I tried the new setup with tuning on instances 6 and 7 and evaluating on 8 and 9
- This worked really well. However, this seems to be largely due to the new test set, not the new tuning, because the old tuning also performs really well on 8 and 9
- See results in the folder results
- Also added the per-budget ratios
- Tried to get familiar with LassoBench
 - How to handle out of bounds cases?
 - Installing it seems to change the environment such that the results that I have so far aren't exactly reproducible. Is that an issue?

Writing

- I am behind with the writing, so I really need to do more here
- Where do I put related work?
- Which experiments do we want to include?
